Press release

FibriTech begins scale-up

From September 2022 FibriTech starts the implementation of a new industrial production process, with the support of the prestigious [European Innovation Council Accelerator](#) program, dedicated to visionary companies that show high potential for growth, have breakthrough solutions and intend to implement them in the European and global markets.

Thanks to the EU's recognition of the potential of FibriTech's technology, which is in line with the implementation of the [Green Deal](#) goals, we will work now on two distinct applications for our universal eco material: [soilless substrates](#) and [protective inserts for packaging](#).

FibriTech creates the technology for unique fibrous materials, based on functional fibrous networks in 3D. It's technology has been recognized in the first of this kind ["Cellulose Fibres Innovation of the Year 2021"](#) competition.

Because of their diverse properties, FibriTech products can be used in many industries: packaging, construction, agriculture.
